1 Abstract

In the realm of financial risk management, understanding and evaluating the level of risk associated with any investment or portfolio is of extremely high importance. Perhaps the most universally regarded metric used for this purpose is Value at Risk (VaR). VaR provides a quantitative estimate of the potential losses that a portfolio may incur over a certain period of time (specified time horizon) at a given confidence level.

Original widespread use of VaR came about in the early 1990s, the concept first being introduced by J.P. Morgan in 1994, since it helped provide an estimate of the maximum loss an investor is willing to accept for any given investment. Its historical roots can be traced back to the financial industry's increasing need for a standardized and comprehensive measure of risk following the 1987 stock market crash, so they sought a comprehensive way to assess risk in complex portfolios [3].

Mathematically, VaR is expressed as follows:

$$VaR(N, X) = -\text{Percentile}(L, 1 - X) \quad (1)$$

Where:

N : Time horizon (in days)

X : Confidence level (in percentage)

L : Loss distribution over N days

This formula captures the loss at the $(100 - X)$ th percentile of the loss distribution over the specified time horizon [6].

VaR can be mathematically computed through various methods, each with its own strengths and limitations. The most common approaches include the historical simulation method, parametric method, model building method and Monte Carlo simulation [1], to list a few. For historical simulation, past data is used to estimate future risk by examining the historical returns of an asset or portfolio, while model building employs mathematical models to predict portfolio performance. The choice of algorithm depends on data availability, computational resources, and specific requirements.

To implement VaR calculations, various pieces of software are essential. In this project, I will be utilising Visual Studio Code (VSCode) as the integrated development environment (IDE) and Python for its rich ecosystem of libraries. Python libraries like NumPy, Matplotlib, and Kivy will be invaluable for data manipulation, visualisation, and user interface design [9].

My inaugural proof of concept program will be created to visually demonstrate VaR calculations for two initial methods, these being historical simulation and model building techniques to estimate VaR for a sample portfolio. Historical simulation would involve collecting historical data and computing VaR based on past performance (can involve acquiring stock data through an API), while model building would use a predefined model to forecast future losses. Visualisation tools like Matplotlib can help in presenting the results graphically, enabling me to generate informative charts and graphs. NumPy will facilitate data manipulation and efficient mathematical operations [10]. Additionally, Kivy, a Python framework for developing multi-touch applications, will be used to

create the interfaces for the visual representation of VaR, as well as giving it the option to possibly be viewed on other devices.

Later on into the project, if there is enough time, I think it may be worth exploring some more advanced topics like the variance-covariance of returns, specifically employing GARCH (Generalized Autoregressive Conditional Heteroscedasticity) models. GARCH models provide a more nuanced understanding of volatility and can enhance the accuracy of VaR estimates [6].

The objective of my project is to gain a deeper understanding of VaR, develop a functional program to calculate and visualise it, and potentially extend the research to incorporate more advanced risk management techniques if possible. This project is a stepping stone towards a deeper understanding of the risk side of finances and will contribute to enhancing the knowledge and skills necessary for effective financial decision-making, since this is not a topic that I have delved much into before, but I have always been very interested in learning more about it. This gives me a fantastic opportunity to learn about the financial sector, as well as create something that is applicable and useful to real life.

2 Timeline

Due to unfortunate circumstances, I've had rough delays to the start of this Project, so Weeks 1-3 will be noted as being a vague learning of the fundamentals behind Value at Risk. I will express this and what I hopefully plan to accomplish with the Project in the timeline below. In the first term, I want to research and create a working program to compute Value at Risk for small portfolios, that has a serviceable GUI that can be expanded on later. I will also make sure to have amply researched about back-testing and how to incorporate it into my program in some capacity. For the second term, I will research and implement applying Value at Risk for a portfolio of derivatives, as well as looking into using the Monte Carlo simulation and allowing for the computation of all this with as many stocks as necessary. I will finalise the GUI and plan to look into completing some of the extensions provided for the project, however this will depend on the overall developmental scope of the project at the time, so they will not be specified here.

2.1 Term 1

Weeks 1-3	Project Research <ul style="list-style-type: none">• Research the fundamentals of Value at Risk (VaR)• Research best coding language to use (Python)• Familiarize myself with LaTeX and prepare IDE & Git for Project specified use
Week 4	Finalize Plan and Start Coding <ul style="list-style-type: none">• Complete Project Plan• Continue researching VaR and Python• Begin project coding
Week 5-7	Coding and Data Preparation <ul style="list-style-type: none">• Continue to work on the VaR program (No GUI)• Start collecting and organizing sample data for small portfolios so it can be used by the program• Finalizing understanding of the two computational methods needed, this being model-building and historical simulation
Week 8	Back-Testing Research & Implementation <ul style="list-style-type: none">• Investigate methods and techniques for VaR back-testing• Start integrating back-testing into the project
Week 9-10	GUI Development <ul style="list-style-type: none">• Initiate the development of the GUI• Ensure the GUI is robust for its current task as well as expandable for future enhancements
Week 11	Interim Report and Presentation Preparation <ul style="list-style-type: none">• Fine-tune programs and report so they are at a satisfactory level, will also allow for easier preparation for the interim presentation• Prepare for the interim presentation

2.2 Term 2

Weeks 1-2	Reflection and Research <ul style="list-style-type: none">• Spend time to reflect on the progress of the project so far, make any changes that I think are warranted after having the winter break time to think about• Research the Monte Carlo simulation method for VaR, as well as how I could start implementing derivatives as portfolios into the project
Week 3-4	Start Implementing New Features <ul style="list-style-type: none">• Start implementing the Monte Carlo simulation method and continue derivative implementation• Start researching Eigen & Cholesky decomposition to allow for however many stocks are needed within a portfolio
Week 5-7	GUI Finalisation <ul style="list-style-type: none">• Decide on the final visual product I want to represent with the GUI and start implementing it (if progress on this needs to continue into the next period, then it will be done so)• Set the program up to work portably/allowing it to work on mobile OS's as well as different desktop OS's
Week 8-9	Extend Project Scope (if time permits) <ul style="list-style-type: none">• Explore additional features or enhancements for the project, possibly decided upon at the start of Term 2• Implement as many as can be appropriately managed, with all additional time spent within this period being used to ensure the project is at its most refined state
Week 10-11	Perfect Final Report <ul style="list-style-type: none">• Make sure the program has been achieved to the best of its ability• Finalise and perfect the final report

3 Key Risks

When developing any form of software or researching into any given field, almost every single factor, from yourself, to the environment around you, to even the state of the planet to an extent, everything must come together and be balanced properly in order for you to reach your goal. This is why it is important to identify the key risks that could potentially hinder any of the many given factors for the project, and to plan for them as accordingly as possible. I will be identifying many of these risks below, ordering them with the ones I find the most important for my specific project at the top, and the ones I find will impact my project the least at the bottom.

3.1 Personal Health

I have this as my most likely risk as I believe it is the most applicable to what I have encountered in the past when being tasked with any assignment over an elongated period of time, such as this Project is. I have personally had various on and off health complications in the past, which can be managed to an extent. Since this has been a norm for me over these last years, I understand its significance and worked towards setting up the best support around me to help mitigate the factors when I can, however for a Project as important as this, it will also involve keeping myself away from anything that could pose at any risk to my health, to make sure that I can continue to work on the Project to the best of my ability.

3.2 Poor Planning and Time Management

Other than the very personally specific problem alluded to above, the most important factor that most will find when conducting any form of large time-frame project will be the ability to manage the time they have been given. In this instance, there are specific deadline and goals throughout the project, so there is a finite time that can be used to complete the required tasks. As a requirement within this project to be able to maximise this more effectively, we have to plan our own timeline (as has already been presented in [timeline section]). Depending on feedback that will be given, it can be ensured that I am aware that I have planned properly and its up to me as an individual to stick to it, to the best of my ability, since if I cannot manage my time properly, then it is highly likely the Project cannot be completed to a satisfactory outcome.

3.3 Software Risk

I will be using various software on my device to be able to research and create programs for this project, all of which could at some point, either due to a design flaw already found within, one that is introduced via an update or an external factor within the digital environment of the device, have issues that could potentially cause problems for the project. The main ones I am worried about are if I have problems with my IDE (VSCode) and with my Git interface (Github Desktop), but to mitigate these factors, I have already looked into and understand how I can continue this project with alternatives (Eclipse & Git Bash for example). Even in the event of the VCS failing (Git), I am making sure that all work completed for this project is also backed up in cloud storage alongside it, as well as another alternative (SVN).

3.4 Hardware Risk

Since I am completing this project with the files being physically stored on my device, there is always the risk that its hardware itself could fail, which could result in the loss of all the work completed for the project. To make sure this does not happen, I have already set up a cloud storage system that will automatically back up all the files I am working on (previously mentioned above) and I have other devices that I know are perfectly capable of being able to continue the project if needed.

3.5 Graphical User Interface (GUI) Design Challenges

Since this project is being presented to and assessed by others outside of just myself, it is important that the GUI is designed in a way that is easy to understand and use, as well as being aesthetically pleasing. This does involve being able to not only understand the fundamentals of GUI design, but be able to creatively display them. I am someone that has always struggled with visual creativity, I have much more confidence in the logical functioning of my endeavours, so to mitigate this lack of confidence, I will be researching into GUI design and make reference to how others perceive good GUI design to ensure that even if I cannot express much creative input, the final result is still satisfactory.

3.6 Testing Challenges

Testing is highly useful, as it allows for the developer to be able to ensure that the program is working as intended. This can be done in different ways, but each have their own possible drawbacks, Test Driven Development (TDD) can ensure the code will always work for the tests but can be time consuming and not always be able to test everything, testing only at the end can be quicker but can lead to difficulty in finding the source of the problem if it is not working as intended. I will be using a combination of both to ensure that I am able to write tests that are not only necessary but happen frequent enough to ensure that the program is producing intended outcomes, whilst also making sure that I am not spending too much time on testing and not enough on the actual program itself.

3.7 Lack of Financial Knowledge

I am aware that this is the first time I have ever looked into the financial side of mathematics/-computation, so I am initially not expecting to be able to understand everything that I will be researching into, but I aim to give myself ample opportunity & resources to understand the fundamentals of finances and the terminology used within it, so that I can comprehend what I am reading and be able to apply it to my project successfully. I will also be making sure to ask for help from my supervisor and other individuals with significant knowledge of the discipline to ensure that I am not making any mistakes in my understanding of the financial sector.

3.8 Balancing Reporting and Coding

When completing a project such as this, one must be able to balance the time spent on the actual coding of the program and the time spent on the reporting of the project. I am well aware that I can get lost in the coding aspect of such a task, since it is what I have always found the most

fulfilling, but that will not help me in the long run if I do not have the reporting to express my work. To mitigate this, I am using LaTeX, so that formatting and presentation is mostly less stressful for me, and I can just focus on the content of the report, as well as following any previous plans I have made for the project to ensure that I am not spending too much time on one aspect of the project. I have also managed to integrate LaTeX functionality into my IDE, so that I can write the report and code in the same place, which will help me be able to balance the two together.

3.9 Online Resource Dependence

Since my program is aiming to take data from an online recourse (Yahoo Finance), there is always the risk that the access to this data could be impacted in some manner, such as the company/website being terminated, which from what I can access online does not appear to be likely. To combat this possible situation, I have explored for a substitute recourse that I know would still have the same utility I need for my project (Alpha Vantage).

3.10 Efficiency Concerns

When running any program, you will want to it run as well as possible, ensuring this through the use of efficient code. Since I have been able to do this before in the past, I believe that this is less likely to occur, especially since I will be using a language that I am not only familiar with, but is also know for its efficiency (Python). I will also be making sure to research into the best methods to ensure that my code is as efficient as possible.

3.11 Portability Considerations

Since my aim for this project is to create a semi-deployable product in the end (not one that is necessarily ready for commercial use, but one that can be used by others), I will need to make sure that the program is able to be used on other devices and operating systems, not just my own. I have made sure to use a language that can be run on multiple platforms (Python) and will be making sure to test the program on other devices and systems so ensure its usability.

4 Bibliography

1. Alexander, C. (2008). *Market Risk Analysis: Value-at-Risk Models.* Hoboken, NJ: Wiley. [Online] Available at: <https://ebookcentral-proquest-com.ezproxy01.rhul.ac.uk/lib/rhul/reader.action?docID=416450>.
This book covers various aspects that I want to approach in this project, such as historical simulation, Monte Carlo simulation and various forms of testing that could be highly useful for my project.
2. Arbuckle, D. (2017). *Daniel Arbuckle's Mastering Python: Build Powerful Python Applications.* Birmingham, England: Packt. [Online] Available at: <https://learning.oreilly.com/library/view/daniel-arbuckles-mastering/9781787283695/?ar=>.
I chose this reference as it helps with python packaging, being able to turn a python code and all its GUI and libraries into a single executable file, which is something I want to be able to do for this project.
3. Choudhry, M. (2006). *An Introduction to Value-at-Risk.* Chichester: John Wiley & Sons Limited. [Online] Available at: <https://learning.oreilly.com/library/view/an-introduction-to/9780470017579/>.

Covers similar topics to the first reference, but seems to go into more detail on specific issues that I may need to address in this project.

4. Duffie, D. and Pan, J. (2019). *An Overview of Value at Risk.* [Online] Available at: <http://web.mit.edu/people/junpan/ddjp.pdf>.
A much shorter reference, it is a paper that covers the basics of Value at Risk, which I will be using to help me understand the fundamentals of the topic since I have been able to follow it better than the other references.
5. Föllmer, H. and Schied, A. (2016). *Stochastic Finance: An Introduction in Discrete Time.* Berlin: de Gruyter. [PDF]
A recommended reference from my supervisor, it is a book that covers higher level concepts relating to my project but also provides an overview of stochastic finance in general, which I have seen to be useful in understanding the topic.
6. Hull, J.C. (2008). *Options, Futures, and Other Derivatives.* Upper Saddle River, NJ: Prentice Hall. [PDF]
This is my main reference for the project, as it is the main textbook suggested. It has a relevant chapter on Value at Risk, which explores many of the different aspects that I will need to look into for this project.
7. Pritsker, M. (1997). "Evaluating Value at Risk Methodologies: Accuracy versus Computational Time." *Journal of Financial Services Research* 12: 201-242. [Online] Available at: <https://doi.org/10.1023/A:1007978820465>.
Another short reference, this is a paper that compares the accuracy and computational time of various Value at Risk methodologies, which I will be using to help me understand the different methodologies and how I can apply them to my project in the most efficient manner.
8. Raman, K. (2015). *Mastering Python Data Visualization: Generate Effective Results in a Variety of Visually Appealing Charts Using the Plotting Packages in Python.* Birmingham: Packt Publishing Limited. [Online] Available at: <https://learning.oreilly.com/library/view/mastering-python-data/9781783988327/?ar=>.
This reference covers various aspects of data visualisation, which I will be using to help me understand how to best display important information in a visually appealing way for my project.
9. Ulloa, R. (2015). *Kivy - Interactive Applications and Games in Python - Second Edition.* Packt Publishing. [Online] Available at: <https://learning.oreilly.com/library/view/kivy-interactive/9781785286926/?ar=>.
This reference is not being used for its content on game development, rather Kivy is a framework that can help create a GUI that works on both desktop operating systems as well as mobile operating systems, which I think I would like to explore the possibility of when developing the application
10. Weiming, J.M. (2015). *Mastering Python for Finance: Understand, Design, and Implement State-of-the-Art Mathematical and Statistical Applications Used in Finance with Python.* Birmingham, England: Packt Publishing. [Online] Available at: <https://learning.oreilly.com/library/view/mastering-python-for/9781784394516/>.
This reference covers various ways of handling financial data within python, which I will ensure to help me understand how to best handle the data I will be using within my project.
